

# G4S SMART VIDEO SOLUTION

Remote video monitoring service with the possibility of mobile patrol

The integrated security service "G4S SMART VIDEO SOLUTION" optimally combines the latest security video technology with a monitoring center and physical security.

## Principle of operation:

The camera uses the built-in intelligent video analysis to detect an attempt to disturb the object. The triggered "silent" alarm is visually verified by the operator in the G4S surveillance center and then alouded to the intruder that he is being monitored and that the mobile patrol is already on his way to intervene. In the event that the intruder is not deterred, the nearest mobile patrol will intervene and, if necessary, the Police of the Czech Republic will be informed.

The camera detects an object violation

The operator verifies the alarm and alerts the intruder via the loudspeaker

If the intruder is not deterred by the message, the mobile patrol will intervene

Intervention of a mobile patrol and possibly the Police of the Czech Republic

# G4S SMART VIDEO SOLUTION

## Key benefits of G4S Smart Video Solution

- Possibility of significant savings in operating costs compared to permanent physical security of the building / complex
- Use of the latest video analytical methods for reliable intrusion detection
- Immediate visual verification of the alarm (source of disturbance) by the operator
- Voice communication with the intruder via loudspeaker - in most cases, after a voice warning, the offender immediately leaves the object without causing damage
- Sending a mobile patrol - if necessary, checking the integrity of the object
